National foreword

This British Standard is the UK implementation of ISO 14388-2:2014.

The UK participation in its preparation was entrusted to Technical Committee EH/4, Soil quality.

A list of organizations represented on this committee can be obtained on request to its secretary.

This publication does not purport to include all the necessary provisions of a contract. Users are responsible for its correct application.

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT) see the following URL: Foreword - Supplementary information

The committee responsible for this document is ISO/TC 190, *Soil quality*, Subcommittee SC 3, *Chemical methods and soil characteristics*.

ISO 14388 consists of the following parts, under the general title *Soil quality — Acid-base accounting procedure for acid sulfate soils*:

— *Part 1: Introduction and definitions, symbols and acronyms, sampling and sample preparation*

— *Part 2: Chromium reducible sulfur (CRS) methodology*

— *Part 3: Suspension peroxide oxidation combined acidity and sulfur (SPOCAS) suite analysis*

Introduction

The objective of this part of ISO 14388 is to determine the net acidity (or alkalinity) of acid sulfate soils by providing a streamlined approach for determination of the various components of soil acidity and/or alkalinity, depending on pH. The chromium suite combines the measurement of chromium reducible sulfur (S_{CR}) with various measures of existing acidity and acid neutralizing capacity (ANC) using a decision-tree based on the value of pH_{KCl} (Figure 1) as the basis for determining an acid-base account for acid sulfate soils.

The results required to determine net acidity vary with the soil's actual acidity, as represented by pH_{KCl}. Table A.1 of ISO 14388-1 shows the analyses required for the Chromium suite. This table uses results reported in acidity units. Alternatively, results in sulfur units can be utilized.

INTERNATIONAL STANDARD ISO 14388-2:2014(E)

Soil quality - Acid-base accounting procedure for acid sulfate soils —

Part 2:
Chromium reducible sulfur (CRS) methodology

WARNING — Persons using this part of ISO 14388 should be familiar with usual laboratory practice. This part of ISO 14388 does not purport to address all of the safety problems, if any, associated with its use. It is the responsibility of the user to establish appropriate safety and health practices and to ensure compliance with any national regulatory conditions.

1 Scope

This part of ISO 14388 specifies a suite of methods used to determine the net acidity in acid sulfate soils. This part of ISO 14388 specifies a method for measuring chromium reducible sulfur (S_{CR}) by iodimetric titration of distilled hydrogen sulfide trapped as zinc sulfide, following acidic chromous chloride digestion. This method determines inorganic sulfides (e.g. pyrite, marcasite, greigite, mackinawite) and elemental sulfur in acid sulfate soil without interferences from organic sulfur and oxidized forms of sulfur such as sulfate.

On a separate test portion of soil, the pH in a 1 mol/l KCl soil suspension (pH_{KCl}) is determined. When pH_{KCl} is < 6,5, titratable actual acidity (TAA) is then determined. Subsequently, potassium chloride extractable sulfur (S_{KCl}), calcium (Ca_{KCl}), and magnesium (Mg_{KCl}) can also be determined. Where jarosite is identified in the soil (or where pH_{KCl} is < 4,5), net acid-soluble sulfur (S_{NAS}) is determined by the difference between hydrochloric acid extractable sulfur (S_{HCl}) and potassium chloride extractable sulfur. On samples where pH_{KCl} is < 6,5, acid neutralizing capacity is determined by measuring either inorganic carbon (C_{IN}) by combustion furnace, or ANC_{BT} (ANC measured by back-titration of acid remaining following an acid digest).
