

Food microbiology

**Method 19.1: Microbiology of food and animal feeding stuffs
— Horizontal method for the enumeration of β -glucuronidase-
positive *Escherichia coli* — Colony-count technique at 44°C
using membranes and 5-bromo-4-chloro-3-indolyl β -D-
glucuronide (ISO 16649-1:2018, MOD)**

AS 5013.19.1:2024

This Australian Standard ® was prepared by FT-035, Food Microbiology. It was approved on behalf of Standards Australia's Standards Development and Accreditation Committee on 5 April 2024.

This Standard was published on 19 April 2024.

The following are represented on Committee FT-035:

ACT Health Directorate
Australian Society for Microbiology Incorporated
CSIRO
Dairy Industry Association of Australia
Department of Agriculture, Fisheries and Forestry
Department of Health (TAS)
National Association of Testing Authorities Australia
National Measurement Institute
PathWest Laboratory Medicine WA
Queensland Health Forensic and Scientific Services
The University of Melbourne

This Standard was issued in draft form for comment as DR AS 5013.19.1:2024.

Preface

This Standard was prepared by the Standards Australia Committee FT-035 Food Microbiology, to supersede AS 5013.19.1—2012, *Food microbiology, Method 19.1: Microbiology of food and animal feeding stuffs—Horizontal method for the enumeration of β -glucuronidase-positive *Escherichia coli*—Colony-count technique at 44°C using membranes and 5-bromo-4-chloro-3-indolyl β -D-glucuronide (ISO 16649-1:2001, MOD)*.

The objective of this document is to specify a horizontal method for the enumeration of β -glucuronidase-positive *Escherichia coli* by colony-count technique after resuscitation using membranes and incubation at 44 °C on a solid medium containing a chromogenic ingredient for detection of the enzyme β -glucuronidase

A list of all parts in the AS 5013 series can be found in the [Standards Australia online catalogue](#).

This document is an adoption with national modifications, and has been reproduced from, ISO 16649-1:2018, *Microbiology of the food chain — Horizontal method for the enumeration of beta-glucuronidase-positive *Escherichia coli* — Part 1: Colony-count technique at 44 °C using membranes and 5-bromo-4-chloro-3-indolyl beta-D-glucuronide*.

The modifications are additional requirements and are set out in [Appendix ZZ](#), which has been added at the end of the source text.

[Appendix ZZ](#) lists the modifications to ISO 16649-1:2018, for the application of this document in Australia.

As this document has been reproduced from an International document, a full point substitutes for a comma when referring to a decimal marker.

Australian or Australian/New Zealand Standards that are identical adoptions of international normative references may be used interchangeably. Refer to the online catalogue for information on specific Standards.

The terms “normative” and “informative” are used in Standards to define the application of the appendices or annexes to which they apply. A “normative” appendix or annex is an integral part of a Standard, whereas an “informative” appendix or annex is only for information and guidance.

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 34, *Food products*, Subcommittee SC 9, *Microbiology*.

This second edition cancels and replaces the first edition (ISO 16649-1:2001), which has been technically revised with the following main changes:

- samples from the environment and the primary production stage have been added to the Scope;
- the minimum length of incubation (20 h) for tryptone-bile X-glucuronide agar (TBX) during culture on selective medium has been adopted;
- performance testing for the quality assurance of the culture media and the membrane for transfer has been added;
- to improve safety for the user, the solvent dimethyl sulphoxide (DMSO) is no longer recommended to dissolve the chromogenic substrate (BCIG);
- the composition of the minerals-modified glutamate agar (MMGA) has been corrected (aspartic acid 0,024 g and arginine 0,02 g) to the values in the original formulation^[12].

A list of all parts in the ISO 16649 series can be found on the ISO website.

Introduction

Because of the large variety of food and feed products, this horizontal method may not be appropriate in every detail for certain products. In this case, different methods which are specific to these products may be used if absolutely necessary for justified technical reasons. Nevertheless, every attempt should be made to apply this horizontal method as far as possible.

The main changes, listed in the Foreword, introduced in this document compared to ISO 16649-1:2001 are considered as minor (see ISO 17468)^[5].

When this document is next reviewed, account will be taken of all information then available regarding the extent to which this horizontal method has been followed and the reasons for deviations from this method in the case of particular products.

The harmonization of test methods cannot be immediate and, for certain groups of products, International Standards and/or national standards may already exist that do not comply with this horizontal method. It is hoped that when such standards are reviewed they will be changed to comply with this document so that eventually the only remaining departures from this horizontal method will be those necessary for well-established technical reasons.

There are three horizontal methods (ISO 16649-1, ISO 16649-2 and ISO 16649-3) for the enumeration of β -glucuronidase-positive *Escherichia coli*^[3]^[4].

The user may choose either ISO 16649-1, ISO 16649-2 or ISO 16649-3. All parts are for general application. However, ISO 16649-1 or ISO 16649-3, which both include a resuscitation step, should be used in preference for foodstuffs likely to contain sub-lethally injured cells as a result of properties associated with the food or processing conditions.

NOTES
