Preface

This Test Method was prepared by the Standards Australia Committee BD-044, Fixing of Ceramic, Natural and Reconstituted Stone Tiles to supersede AS 4459.9—1997, *Methods of sampling and testing ceramic tiles — Part 9: Determination of resistance to thermal shock*.

The objective of this Test Method is to specify a test method for determining the resistance to thermal shock of all ceramic tiles under normal conditions of use.

This Test Method is identical with, and has been reproduced from, ISO 10545-9:2014, *Ceramic tiles — Part 9: Determination of resistance to thermal shock*.

As this document has been reproduced from an International Standard, the following applies:

- (a) In the source text “this part of ISO 10545” should read “this Australian Standard”.
- (b) A full point substitutes for a comma when referring to a decimal marker.

Australian or Australian/New Zealand Standards that are identical adoptions of international normative references may be used interchangeably. Refer to the online catalogue for information on specific Standards.

The terms “normative” and “informative” are used in Standards to define the application of the appendices or annexes to which they apply. A “normative” appendix or annex is an integral part of a Standard, whereas an “informative” appendix or annex is only for information and guidance.
