STANDARDS
Australia

Recreational diving services — Requirements for rebreather diver training — Decompression diving to 100 m

AS ISO 24807:2024

This Australian Standard® was prepared by CS-083, Recreational Underwater Diving. It was approved on behalf of Standards Australia's Standards Development and Accreditation Committee on 26 May 2024.

This Standard was published on 7 June 2024.

The following are represented on Committee CS-083:

- Association of Marine Park Tourism Operators (Qld)
- Australian Underwater Federation
- Australian Underwater Scuba Instructors
- Global Underwater Explorers
- PADI Asia Pacific
- RAID International
- Scuba Schools International Australia
- TDI/SDI Australia & New Zealand

This Standard was issued in draft form for comment as DR AS ISO 24807:2024.

Preface

This Standard was prepared by the Standards Australia Committee CS-083, Recreational Underwater Diving.

The objective of this document is to specify requirements for rebreather diver training programmes which provide the competencies required to perform dives to 100 m with a rebreather using a breathing mixture containing helium and requiring mandatory decompression stops.

This document specifies evaluation criteria for these competencies.

This document specifies the requirements under which training is provided, in addition to the general requirements for recreational diving service provision in accordance with AS ISO 24803:2021.

This document is identical with, and has been reproduced from, ISO 24807:2023, *Recreational diving services – Requirements for rebreather diver training – Decompression diving to 100 m*.

As this document has been reproduced from an international document, a full point substitutes for a comma when referring to a decimal marker.

Australian or Australian/New Zealand Standards that are identical adoptions of international normative references may be used interchangeably. Refer to the online catalogue for information on specific Standards.

The terms “normative” and “informative” are used in Standards to define the application of the appendices or annexes to which they apply. A “normative” appendix or annex is an integral part of a Standard, whereas an “informative” appendix or annex is only for information and guidance.

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

ISO draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents. ISO shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 228, *Tourism and related services*, in collaboration with the European Committee for Standardization (CEN) Technical Committee CEN/TC 329, *Tourism services*, in accordance with the Agreement on technical cooperation between ISO and CEN (Vienna Agreement).

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

Rebreathers (i.e. breathing devices that recirculate some or all of the diver's exhaled breath and replenish any consumed oxygen to maintain a breathable mixture) are becoming much more widely available and popular among divers. The market for rebreather diving has been constantly growing in recent years and is now considered to be large enough that the need for standards for training organizations on minimum training requirements is evident. Rebreathers allow divers to dive for longer and to greater depths. Such depths can go beyond 30 m and can therefore require mandatory decompression stops. If rebreathers are used improperly, they can be hazardous; divers have had fatal accidents due to incorrect use of these devices. It is therefore important to specify training for diving with such devices.

Training organizations offering training that conforms with this document may exceed any of the requirements in terms of the volume or complexity of training but should at least ensure the students master all the skills and knowledge defined in this document.

Australian Standard®

Recreational diving services — Requirements for rebreather diver training — Decompression diving to 100 m

1 Scope

This document specifies requirements for rebreather diver training programmes which provide the competencies required to perform dives to 100 m with a rebreather using a breathing mixture containing helium and requiring mandatory decompression stops.

This document specifies evaluation criteria for these competencies.

This document specifies the requirements under which training is provided, in addition to the general requirements for recreational diving service provision in accordance with ISO 24803.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 24801-3, *Recreational diving services — Requirements for the training of recreational scuba divers — Part 3: Level 3 — Dive leader*

ISO 24802-2, *Recreational diving services — Requirements for the training of scuba instructors — Part 2: Level 2*

ISO 24803, *Recreational diving services — Requirements for recreational diving providers*

ISO 24806, *Recreational diving services — Requirements for rebreather diver training — Decompression diving to 60 m*

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <https://www.electropedia.org/>

3.1

rebreather

apparatus that has a supply of gas carried by the diver, allowing the diver to breathe under water which enables the diver to inspire gas from a facepiece connected to a counterlung and to pass exhaled gas through a carbon dioxide absorption material before it is re-breathed from the counterlung and inspired partial pressure of the gases within the apparatus remain within acceptable physiological limits so that gas is thus recirculated within the apparatus

Note 1 to entry: A rebreather can also be called a self-contained rebreathing apparatus.

Note 2 to entry: A facepiece can be a mouthpiece assembly, a half mask, a full-face mask or a helmet.

[SOURCE: EN 14143:2013, 3.1, modified — Note 1 to entry modified and Note 2 to entry added. This content has been reproduced with the permission of CEN. Copyright remains with CEN.]

3.2 rebreather type

primary rebreather design

EXAMPLE Closed-circuit rebreather (CCR), manually controlled closed-circuit rebreather (mCCR), electronically controlled closed-circuit rebreather (eCCR), semiclosed-circuit rebreather (SCR), manually controlled SCR (mSCR), electronically controlled SCR (eSCR), hybrid closed-circuit rebreather (hCCR).

3.3 rebreather unit

type of *rebreather* (3.1) having consistent controls, displays and configuration over several *rebreather models* (3.4), where the operation is essentially the same from rebreather model to rebreather model

3.4 rebreather model

specific individual design of *rebreather* (3.1) made by a manufacturer

3.5 breathing gas

gas present in the *breathing loop* (3.11) inspired by the diver

3.6 supply gas

gas present in a cylinder which can be added to the *breathing loop* (3.11)

3.7 bailout gas

gas present in a cylinder that can be breathed directly by the diver

3.8 PO₂

partial pressure of oxygen in a gas mixture

Note 1 to entry: This usually refers specifically to the breathing-gas mixture inhaled by a diver.

3.9 set-point PO₂ set-point

PO₂ value that is used by a control system to determine when a solenoid valve injects oxygen into the *breathing loop* (3.11)

3.10 respiratory minute volume RMV

product of the tidal volume and breathing frequency measured in litres per minute

[SOURCE: EN 14143:2013, 3.10]

3.11 breathing loop

portion of a *rebreather* (3.1) through which gas circulates, usually consisting of a mouthpiece, breathing hose(s), counterlung(s), non-return valves and a CO₂ absorbent canister

3.12 scrubber

canister in the *breathing loop* (3.11) containing CO₂ absorbent

3.13**confined water**

swimming pool with a depth appropriate to the activity or body of water, offering similar conditions with regard to visibility, depth, water movement and access

[SOURCE: ISO 24801-2:2014, 3.5]

3.14**open water**

body of water significantly larger than a swimming pool, offering conditions typical of a natural body of water

[SOURCE: ISO 24801-2:2014, 3.6]

3.15**limited open water**

open water (3.14) no deeper than 20 metres with no appreciable water movement and visibility that is sufficient to allow effective student supervision and skill development

3.16**service provider**

entity (individual or organization), including any individual acting on behalf of such an entity, which offers one or more of the following services:

- introductory diving activities;
- snorkelling excursions;
- provision of training and education;
- organized and guided diving for qualified divers;
- rental of diving equipment.

[SOURCE: ISO 24803:2017, 3.1]

3.17**safety stop**

non-mandatory *decompression stop* (3.18) near the surface prior to surfacing

3.18**decompression stop**

mandatory stop during ascent from depth prior to surfacing

3.19**decompression diving**

diving with mandatory *decompression stops* (3.18)

3.20**delayed surface marker buoy****DSMB**

surface marker buoy that can be deployed by a diver from underwater

4 Competencies

The training programme shall ensure that students are qualified to independently plan and conduct dives requiring mandatory decompression stops using the specific rebreather unit for which the diver has received training.
