

Designation: A 327M – 91 (Reapproved 1997)

METRIC

Standard Test Methods for Impact Testing of Cast Irons (Metric)¹

This standard is issued under the fixed designation A 327M; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 These test methods for impact testing cover the details of apparatus, test specimens and procedures for cast iron, including gray iron, white iron, malleable iron, ductile iron, and austempered ductile iron, but not including chilled rolls or rolls with white iron skins.

1.2 The values stated in SI units are to be regarded as the standard. A companion standard, A 327, lists values in inch-pound units.

1.3 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

E 23 Test Methods for Notched Bar Impact Testing of Metallic Materials²

METHOD A—ROUND BAR CHARPY-TYPE IMPACT TEST FOR GRAY AND WHITE IRONS

3. Scope

3.1 The Charpy-type impact test shall be employed for testing gray and white irons.

4. Apparatus

4.1 The single-blow Charpy impact test for gray and white irons shall be carried out in a pendulum-type impact machine with a capacity of at least 150 J as used for the simple beam test for steel described in Test Methods E 23.

¹ These test methods are under the jurisdiction of ASTM Committee A-4 on Iron Castings and are the direct responsibility of Subcommittee A04.21 on Testing.

Current edition approved April 15, 1991. Published November 1991.

² *Annual Book of ASTM Standards*, Vol 03.01.

5. Test Specimens

5.1 The test specimens shall have a plain cylindrical form, machined or ground to a smooth finish and shall conform to the following dimensions:

	Type A	Type M
Diameter	28.575 ± 0.050 mm	20.00 ± 0.03 mm
Length	200 ± 13 mm	120 ± 2 mm
Span	152.0 ± 0.7 mm	100.0 ± 0.5 mm

6. Procedure

6.1 Test the bars on the spans indicated in the tabular data of 5.1. In all other respects, the test shall conform to the appropriate requirements of Test Methods E 23.

6.2 Make the test at room temperature.

6.3 Characterization of the fracture toughness of any cast iron should be based upon testing at least three specimens.

NOTE 1—Care should be taken to examine broken specimens for indication of anvil interference, which will give erroneous results.

7. Report

7.1 The results shall be reported as ____ J cast iron charpy impact with ____ mm diameter bar.

METHOD B—STANDARD CHARPY-TYPE IMPACT TEST FOR MALLEABLE AND DUCTILE IRONS

8. Scope

8.1 Either the standard notched or unnotched charpy impact test shall be employed in testing of malleable or ductile irons. Selection of the type bar is dependent upon the specific material to be evaluated as defined in Section 9.

8.2 Both types of charpy bars have been designated to characterize the fracture toughness of irons. The unnotched charpy bar, when tested, will produce substantially higher energy values than the notch bar type. The unnotched bar is therefore specified for testing irons that have low fracture toughness characteristics.

9. Charpy Test Bar Type

9.1 Unless specified otherwise, the notched bar type specimens in Figs. 1 and 2 (for pipe type products) shall be employed. Exceptions are defined in 9.2 and 9.3.

9.2 The unnotched Charpy type specimen in Fig. 3 shall be employed for testing of all grades of austempered ductile iron. These irons are tested after the austempering heat treatment.

9.3 The unnotched Charpy type specimen may be specified for other types of irons or irons that have been heat treated in various ways other than austempering, by specific agreement between producer and purchaser.

10. Apparatus

10.1 The single-blow Charpy test for ductile and malleable iron shall be carried out in a pendulum-type impact machine with a capacity of at least 150 J as used for the simple beam test for steel described in Test Methods E 23.

10.2 Standard machines may be modified by using a more sensitive scale, or pendulum machines of a lower capacity may be used where values of less than 34 J will be obtained.

11. Test Specimens

11.1 Except for pipe, the test specimen shall have the shape and dimensions as shown in Fig. 1 for notch Charpy bars and Fig. 3 for unnotched Charpy bars. Bars must have a smooth machined or ground surface finish. The notched area of notch type bars shall be free of any burrs or machining marks that could be judged to adversely influence test values.

11.2 In the case of malleable or ductile irons that are to be tested after heat treatment, such as austempered ductile irons, final finish grinding of longitudinal faces and cutting of the notch must be performed after completion of all heat treatment operations.

11.3 Test specimens taken from ductile iron pipe shall be 0.500 in. wide, measured from the notched face. The thickness of the notched face shall be equal to the full wall thickness of the pipe, t , except that specimens in which the pipe wall

NOTE—Permissible variations shall be as follows:

Adjacent sides shall be at	$90^\circ \pm 10 \text{ min}$
Cross section dimensions	$\pm 0.03 \text{ mm}$
Length of specimen	$+0, -2.5 \text{ mm}$
Angle of notch	$\pm 1^\circ$
Radius of notch	$\pm 0.03 \text{ mm}$
Dimension to bottom of notch	$\pm 0.03 \text{ mm}$
Distance to notch, $L/2$	$\pm 1 \text{ mm}$

FIG. 1 Standard Vee Notch Charpy Bar Impact Test Specimen

NOTE 1—The symbol t is for the pipe wall thickness.

NOTE 2—Permissible variations for $L/2$ shall be $\pm 1 \text{ mm}$.

FIG. 2 Impact Test Specimen for Ductile Iron Pipe and Tube

NOTE—Permissible variations shall be as follows:

Adjacent sides shall be at	$90^\circ \pm 10 \text{ min}$
Cross section dimensions	$\pm 0.03 \text{ mm}$
Length of specimen	$+0, -2.5 \text{ mm}$

FIG. 3 Unnotched Charpy Bar Impact Test Specimen

specimen thickness exceeds the maximum height accommodated by the impact test machine shall be machined to a thickness that can be accommodated by the machine. Specimens shall be machined in accordance with Fig. 2.

12. Procedure

12.1 Test the specimen in accordance with the procedures set forth in Test Methods E 23.

12.2 Unless otherwise specified, the test shall be performed at $21 \pm 5.5^\circ\text{C}$.

12.3 For testing at other than room temperature, accuracy of results is ensured by following the procedure outlined in Test Methods E 23.

12.4 Characterization of the fracture toughness of any cast iron should be based upon testing at least three specimens.

13. Report

13.1 For malleable or ductile irons, the results shall be reported as ____ J at ____ $^\circ\text{C}$, “standard notched Charpy test” or “standard unnotched Charpy test,” depending upon which specimen type was employed.
