

Testing coated fabrics —

Part 31: Method 34: Method for determination of resistance to scuffing and snagging

IMPORTANT NOTE. It is recommended that this Part be read in conjunction with the information in Part 0 “Foreword and general introduction”.

Confirmed January 2011

Foreword

During use coated fabrics are commonly subjected to rapid glancing blows or direct impacts against hard objects and surfaces. If the object is sharp or pointed, a cut or snag of the material may be caused. If the object is blunt, then rather more extensive, but perhaps less severe, abrasion or scuffing damage will be produced.

The present method simulates both types of damage, and it is envisaged that the method will prove relevant in the assessment of materials for such applications as shoe uppers, travel goods, protective clothing, buoyancy aids and inflatables.

A British Standard does not purport to include all the necessary provisions of a contract. Users of British Standards are responsible for their correct application.

Compliance with a British Standard does not of itself confer immunity from legal obligations.

Summary of pages

This document comprises a front cover, an inside front cover, pages i and ii, pages 1 to 6, an inside back cover and a back cover.

This standard has been updated (see copyright date) and may have had amendments incorporated. This will be indicated in the amendment table on the inside front cover.

Amendments issued since publication

Amd. No.	Date of issue	Comments

This British Standard, having been prepared under the direction of the Fibres, Yarns, Fabrics and Production Standards Policy Committee, was published under the authority of the Board of BSI and comes into effect on 31 October 1990
