National foreword

This British Standard is the UK implementation of EN ISO 15848-1:2015+A1:2017. It supersedes BS EN ISO 15848-1:2015 which is withdrawn.

The start and finish of text introduced or altered by amendment is indicated in the text by tags. Tags indicating changes to ISO text carry the number of the ISO amendment. For example, text altered by ISO amendment 1 is indicated by A1 A1.

The UK participation in its preparation was entrusted by Technical Committee PSE/18, Industrial valves, steam traps, actuators and safety devices against excessive pressure, to Subcommittee PSE/18/1, Industrial valves, steam traps, actuators and safety devices against excessive pressure - Valves - Basic standards.

A list of organizations represented on this subcommittee can be obtained on request to its secretary.

This publication does not purport to include all the necessary provisions of a contract. Users are responsible for its correct application.

Klassifizierungssystem und Qualifikationsverfahren für die
Bauartprüfung von Armaturen (ISO 15848-1:2015)

This European Standard was approved by CEN on 7 February 2015.

CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration. Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the CEN-CENELEC Management Centre or to any CEN member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and United Kingdom.

Foreword

This document (EN ISO 15848-1:2015) has been prepared by Technical Committee ISO/TC 153 “Valves” in collaboration with Technical Committee CEN/TC 69 “Industrial valves” the secretariat of which is held by AFNOR.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by December 2015, and conflicting national standards shall be withdrawn at the latest by December 2015.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN [and/or CENELEC] shall not be held responsible for identifying any or all such patent rights.

This document supersedes EN ISO 15848-1:2006.

According to the CEN-CENELEC Internal Regulations, the national standards organizations of the following countries are bound to implement this European Standard: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

Endorsement notice

The text of ISO 15848-1:2015 has been approved by CEN as EN ISO 15848-1:2015 without any modification.

Foreword to amendment A1

This document (EN ISO 15848-1:2015/A1:2017) has been prepared by Technical Committee ISO/TC 153 “Valves” in collaboration with Technical Committee CEN/TC 69 “Industrial valves” the secretariat of which is held by AFNOR.

This Amendment to the European Standard EN ISO 15848-1:2015 shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by September 2017, and conflicting national standards shall be withdrawn at the latest by September 2017.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN [and/or CENELEC] shall not be held responsible for identifying any or all such patent rights.

According to the CEN-CENELEC Internal Regulations, the national standards organizations of the following countries are bound to implement this European Standard: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

Endorsement notice

The text of ISO 15848-1:2015/Amd 1:2017 has been approved by CEN as EN ISO 15848-1:2015/A1:2017 without any modification.

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the WTO principles in the Technical Barriers to Trade (TBT), see the following URL: [Foreword — Supplementary information](#).

The committee responsible for this document is ISO/TC 153, *Valves*, Subcommittee SC 1, *Design, manufacture, marking and testing*.

This second edition cancels and replaces the first edition (ISO 15848-1:2006) which has been technically revised. The main changes are the following:

- leak rate at the stem seal ([Table 1](#)) is expressed in $\text{mbar}\cdot\text{l}\cdot\text{s}^{-1}$ per mm stem diameter;
- flushing method is replaced by accumulation or suck through method to measure leak rate from stem seal with Helium ([Annex A](#));
- leakage is expressed in ppmv; leakage with methane is measured by sniffing;
- for tightness Class AH, leak rate $\leq 1,78\cdot 10^{-7} \text{ mbar}\cdot\text{l}\cdot\text{s}^{-1}\cdot\text{mm}^{-1}$ ($10^{-5} \text{ mg}\cdot\text{s}^{-1}\cdot\text{m}^{-1}$);
- the appropriate leak rate is given for Classes BH and CH;
- addition of [Table 3](#) which gives tightness classes for stem (or shaft) seals with methane;
- there is no correlation intended between the tightness classes when the test fluid is helium (Classes AH, BH, CH) and when the test fluid is methane (Classes AM, BM, CM);
- modification of the number of mechanical cycles for isolating valves;
- addition of [Table 4](#);
- addition of [Figures 3, 4, and 5](#);
- addition of type leak ([A.1.3.4](#), [B.1.4.2](#), [B.1.6.1](#));
- modification of [Figure B.2](#);
- modification of [B.1.6.1](#) on calibration procedures;
- deletion of Figure B.3;

- addition of [Table C.1](#) and modification of [Table C.2](#).

ISO 15848 consists of the following parts, under the general title *Industrial valves — Measurement, test and qualification procedures for fugitive emissions*:

- *Part 1: Classification system and qualification procedures for type testing of valves*
- *Part 2: Production acceptance test of valves*

Introduction

The objective of this part of ISO 15848 is to enable classification of performance of different designs and constructions of valves to reduce fugitive emissions.

This part of ISO 15848 defines type test for evaluation and qualification of valves where fugitive emissions standards are specified.

The procedures of this part of ISO 15848 can only be used with the application of necessary precautions for testing with flammable or inert gas at temperature and under pressure.

Industrial valves — Measurement, test and qualification procedures for fugitive emissions —

Part 1: Classification system and qualification procedures for type testing of valves

1 Scope

This part of ISO 15848 specifies testing procedures for evaluation of external leakage of valve stem seals (or shaft) and body joints of isolating valves and control valves intended for application in volatile air pollutants and hazardous fluids. End connection joints, vacuum application, effects of corrosion, and radiation are excluded from this part of ISO 15848.

This part of ISO 15848 concerns classification system and qualification procedures for type testing of valves.

2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 5208, *Industrial valves — Pressure testing of metallic valves*

EN 13185:2001, *Non-destructive testing — Leak testing — Tracer gas method*

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

3.1

body seals

any seal in pressure containing part except stem (or shaft) seals

3.2

Class

convenient round number used to designate pressure-temperature ratings

Note 1 to entry: It is designated by the word “Class” followed by the appropriate reference number from the following series: Class 125, Class 150, Class 250, Class 300, Class 600, Class 900, Class 1 500, Class 2 500.

3.3

concentration

ratio of test fluid volume to the gas mixture volume measured at the leak source(s) of the test valve

Note 1 to entry: The concentration is expressed in ppmv¹⁾.

1) Parts per million volume is a unit deprecated by ISO. 1 ppmv = 1 ml/m³ = 1 cm³/m³.

3.4

control valve

power operated device which changes the fluid flow rate in a process control system and which consists of a valve connected to an actuator that is capable of changing the position of a closure member in the valve in response to a signal from the controlling system

3.5

fugitive emission

chemical or mixture of chemicals, in any physical form, which represents an unanticipated or spurious leak from equipment on an industrial site

3.6

leakage

loss of the test fluid through the stem (or shaft) seal or body seal(s) of a test valve under the specified test conditions and which is expressed as a concentration or a leak rate

3.7

leak rate

mass flow rate of the test fluid, expressed in $\text{mg}\cdot\text{s}^{-1}$ per millimetre of stem diameter through stem seal system or volumic flow rate of the test fluid, expressed in $\text{mbar}\cdot\text{l}\cdot\text{s}^{-1}$ per millimetre of stem diameter through stem seal system

3.8

local leakage

measurement of the test fluid leakage using a probe at the leak source point

3.9

mechanical cycle of control valves

for linear/rotary control valves, test cycles performed at 50 % of stroke/angle with an amplitude of ± 10 % of full stroke/angle

3.10

mechanical cycle of isolating valves

motion of a valve obturator moving from fully closed position to fully opened position, and returning to fully closed position

3.11

nominal size

DN

alphanumeric designation of size for components of a pipework system, which is used for reference purposes, comprising the letters DN followed by a dimensionless whole number which is indirectly related to physical size, in millimetres, of the bore or outside diameter of the end connections

Note 1 to entry: The nominal diameter is designated by the letters DN followed by a number from the following series: 10, 15, 20, 25, 32, 40, 50, 65, 80, 100, 125, 150, 200, 250, 300, 350, 400, etc.

Note 2 to entry: The number following the letters DN does not represent a measurable value and should not be used for calculation purposes except where specified in the relevant standard.

Note 3 to entry: Adapted from ISO 6708:1995, definition 2.1.

3.12

nominal pressure

PN

numerical designation relating to pressure, which is a convenient rounded number for reference purposes, comprising the letters PN followed by the appropriate reference number

Note 1 to entry: All equipment of the same nominal size (DN) designated by the same PN number have compatible mating dimensions.

Note 2 to entry: The maximum allowable working pressure depends upon materials, design, and working temperatures and is selected from the pressure/temperature rating tables in the appropriate standards.

Note 3 to entry: The nominal pressure is designated by the letters PN followed by the appropriate reference number from the following series: 2,5, 6, 10, 16, 20, 25, 40, 50, etc.

Note 4 to entry: Adapted from ISO 7268:1983, definition 2.1.

3.13

isolating valve

valve intended for use principally in the closed or open position which can be power actuated or manually operated

3.14

performance class

level of the performance of a test valve

Note 1 to entry: The performance classes are defined in [Clause 6](#).

3.15

room temperature

temperature in the range of +5 °C to +40 °C, adjusted before the test 

3.16

stem

shaft

valve component extending into the valve shell to transmit the linear/rotary motion from the actuating device to the valve obturator

3.17

stem seal

shaft seal

component(s) installed around the valve stem (or shaft) to avoid leakage of internal fluids to atmosphere

3.18

test pressure

pressure used for testing the valve which, unless otherwise specified, is the rated pressure specified at the test temperature and the shell material of a test valve in the relevant standards

3.19

test temperature

fluid temperature selected for the test as measured inside the test valve

Note 1 to entry: The test temperature is given in [Table 5](#).

3.20

thermal cycle

change of the temperature from the room temperature to the specified test temperature and return to the room temperature

3.21

total leakage

collection of leakage of the test fluid at the leak source using an encapsulation method

3.22

type test

a test conducted to establish the performance class of a valve

4 Symbols and abbreviations

M_{alr} predicted maximum leakage

SSA stem (or shaft) seal adjustment

OD_{stem} stem outside diameter

RT room temperature

NOTE The abbreviation SSA corresponds to the abbreviation of “Stem Seal Adjustment”.

5 Type test

5.1 Test conditions

5.1.1 Preparation of a valve to be tested

Only a fully assembled valve shall be used for the test.

A valve shall be selected from standard production at random. The valve shall have been tested and accepted in accordance with ISO 5208 or any other applicable standard and no subsequent protective coating shall have been applied.

Additional seal arrangements to allow the stem sealing system leakage measurement is permitted and shall not affect the sealing performance of the valve.

The test valve interior shall be dried and lubricants (if any) shall be removed. The valve and test equipment shall be clean and free of water, oil, and dust and the packing may be changed prior to the test. If the valve packing is changed prior to the test, it should be done under the supervision of the valve manufacturer.

If a test valve is equipped with a manually adjustable stem (or shaft) seal(s), it shall be initially adjusted according to the manufacturer's instructions and recorded in the test report as provided in [Clause 7](#).

The valve manufacturer shall select the appropriate actuating device.

5.1.2 Test fluid

The test fluid shall be helium gas of 97 % minimum purity or methane of 97 % minimum purity. The same test fluid shall be used throughout the test.

5.1.3 Test temperature

Valve mechanical cycling is carried out at the room temperature or in the steps of the room temperature and the selected test temperature other than the room temperature (see [5.2.4.1](#)).

The test temperature shall be recorded for each leakage measurement.

5.1.4 Measurement of test valve temperature

The temperature of the test valve shall be measured at three locations, as shown in [Figure 1](#), and recorded in a test report.

- a) Measurement at location 1 shall be used to determine the test temperature.
- b) Measurement at location 2 is also made for information. Any use of insulation shall be detailed in the test report.
- c) Measurement at location 3 is used to determine the external valve temperature adjacent to the stem (or shaft) seal(s) for information.
- d) Measurement at location 4 is an option if measurement location 1 is not possible (except in the case where heating elements penetrate the blind flanges).

All temperatures at location 1, 2, and 3 (and 4) shall be stabilized before leakage is measured (see [Figures 2](#) and [3](#)). Temperature at location 3 shall be stabilized for minimum 10 min prior to leakage measurement.

Check if the temperature variation is within $\pm 5\%$.

Key

- 1 location 1: flow path (temperature T_1)
- 2 location 2: valve body (temperature T_2)
- 3 location 3: stuffing box (temperature T_3)
- 4 location 4: optional for flow path (temperature T_1)

Figure 1 — Measurements of temperature

Key

t_0	stabilization of temperature at location 3 (stuffing box)
$t_0 + 10 \text{ min}$	start of mechanical cycles

Figure 3 — Stabilization of temperatures (when the valve is externally heated or cooled)

5.1.5 Leakage measurement

5.1.5.1 Stem (or shaft) leakage measurement

Leakage shall be measured from a test valve at rest in the partly open position.

The leakage measurement shall be performed

- by the global method (vacuum or bagging) according to the procedures described in [Annex A](#), or
- by the local leakage measurement (sniffing) according to the procedures described in [B.2](#).

5.1.5.2 Body seal leakage measurement

The local leakage shall be measured by sniffing method according to the procedure described in [Annex B](#).

Evaluation of the end connections should be done to ensure that they do not affect the results of the evaluation of the body seals.

5.1.5.3 Leakage-measurement records

All results of leakage measurements shall be recorded in a test report as specified in [Clause 7](#).

5.2 Test procedures

5.2.1 Safety rules

Testing with high pressure gas is potentially hazardous and thus all applicable local safety rules and adequate safety measures shall be followed. If methane (CH₄) is used, the combination of the test pressure and temperature shall be reviewed for possible combustion concerns.

5.2.2 Test equipment

The test equipment shall be appropriately selected to

- a) apply and maintain the test pressure within a range of ± 5 % of the nominal value,
- b) apply valve mechanical cycles,
- c) heat or cool the test valve to the selected test temperature and maintain it within a range of ± 5 % but not exceeding 15 °C; no mechanical cycling is permitted during temperature change,
- d) measure and record time, pressure, temperature, leakage, and duration of a valve mechanical cycle,
- e) measure and record actuation forces or torques to operate a test valve, and
- f) measure and record the stem sealing system loading, if applicable.

5.2.3 Stem (or shaft) seal adjustment (SSA)

5.2.3.1 Number of stem seal adjustment

Mechanical adjustments of stem (or shaft) sealing system during the type test shall be permitted only once, as shown below, for each of qualification stage done according to [Figures 4, 5, and 6](#), if stem (or shaft) leakage has been measured in excess of the target tightness class selected from [Tables 1 to 4](#).

The maximum retightening force (or torque) to apply shall be determined prior to the type test.

EXAMPLE

- A maximum of one adjustment is accepted for CC1 or CO1.
- A maximum of two adjustments is accepted for CC2 or CO2.
- A maximum of three adjustments is accepted for CC3 or CO3.

5.2.3.2 Test failure after stem seal adjustment

If a stem (or shaft) sealing arrangement fails to achieve the target tightness class, or it is not possible to continue mechanical cycling, the test shall be considered terminated, and the test valve shall be evaluated for qualification of lower tightness and endurance classes, if applicable.

5.2.3.3 Reporting the number of SSA

The total number of stem (or shaft) seal adjustment shall be recorded in the test report and indicated in the designation of the valve classification as “SSA-1”, “SSA-2”, and “SSA-3”.

5.2.4 Test description

5.2.4.1 General

The test description is the following:

- a) The test valve shall be mounted on a test rig, according to the instructions given by the manufacturer.
- b) The valve mounting shall be principally made with a stem (or shaft) positioned vertical. A valve intended for use in other positions shall be mounted with the stem (or shaft) positioned horizontally.
- c) All sealing systems shall have been properly adjusted beforehand, according to the manufacturer's instructions. For valves using packings as a stem seal, the tightening torque of the gland boltings shall be measured and recorded at the beginning of the test and after any stem seal adjustment.
- d) The target number and combination of mechanical and thermal cycles shall be selected from the endurance classes specified in [Figures 4, 5, and 6](#).
- e) Leakage from the stem (or shaft) seal and from the body seals shall be separately measured. If the valve does not allow such a separate measurement, the total leakage of both stem (or shaft) and body seals shall be measured at the same time according to [Annex A](#) and [Annex B](#) respectively.
- f) Actual methods of mechanical cycles other than those specified in [5.2.4.2](#) and [5.2.4.3](#) shall be in accordance with the manufacturer's instructions, and opening, closing, and dwelling time shall be recorded in the test report. Basically, they shall represent the intended operating conditions of a test valve.
- g) Valve opening and closing force (or torque) shall be measured and recorded at the start and at the end of the test, following subsequent stem seal adjustments if applicable.

5.2.4.2 Mechanical cycles of isolating valves

Unless otherwise specified by the valve manufacturer, the valve seating force (or torque) required for tightness under a differential pressure of 0,6 MPa (6 bar), air or inert gas shall be used as the minimum force (or torque) for mechanical cycle of a test valve.

Fully back seating a test valve is not required.

5.2.4.3 Mechanical cycles of control valves

The stem motion of linear action valves shall be between 1 mm/s and 5 mm/s. The shaft motion of rotary control valves shall be between 1°/s and 5°/s.

The actuator to operate a test valve shall withstand only the pressure and friction force (or torque) acting on the valve stem, and these values shall be recorded.

NOTE Measurement of friction force (or torque) is principally intended to check the packing friction usually expressed as the dead band.

5.2.4.4 Preliminary tests at the room temperature (test 1)

The tests are carried out as shown below.

- a) Pressurize a test valve with the test fluid to the test pressure as specified in a relevant standard.
- b) After the test pressure has been stabilized, measure leakages both from the stem (or shaft) seal and from the body seals, in accordance with [Annexes A](#) and [B](#), respectively.
- c) Record the test result in a test report.
