

BSI Standards Publication

Aerospace — High-power solid-state power controller — General performance requirements

National foreword

This British Standard is the UK implementation of [ISO 24065:2023](#).

The UK participation in its preparation was entrusted to Technical Committee ACE/6, Aerospace avionic electrical and fibre optic technology.

A list of organizations represented on this committee can be obtained on request to its committee manager.

Contractual and legal considerations

This publication has been prepared in good faith, however no representation, warranty, assurance or undertaking (express or implied) is or will be made, and no responsibility or liability is or will be accepted by BSI in relation to the adequacy, accuracy, completeness or reasonableness of this publication. All and any such responsibility and liability is expressly disclaimed to the full extent permitted by the law.

This publication is provided as is, and is to be used at the recipient's own risk.

The recipient is advised to consider seeking professional guidance with respect to its use of this publication.

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

ISO draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents. ISO shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 20, *Aircraft and space vehicles*, Subcommittee SC 1, *Aerospace electrical requirements*.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

For aircrafts electrical power systems, there is a trend toward higher voltage and higher current systems. There are several advantages in using a solid-state power controller (SSPC) for the distribution system. A standard of the SSPC for lower electrical power supply has been established ([ISO 27027](#)); but the standard for the SSPC for higher electrical power supply, which is intended for application in the primary power distribution of aircrafts, has not been established. Therefore, it is necessary to develop a standard for the high-power solid-state power controller (HPSSPC).

The purpose of this document is to standardize the requirements for HPSSPCs that are physically and environmentally diversified.

The HPSSPC:

- a) consists of a solid-state switching device and its driver circuit;
- b) turns on or off the power output by receiving the control signal;
- c) detects the over current in the load which results in limiting or shutting down this current, and/or optionally detects the arc fault in the circuit which results in shutting down the fault;
- d) has the built-in test function which can detect the health status of itself;
- e) indicates the on or off status of the power output.

In order to satisfy this purpose, this document specifies requirements such as physical, environmental and individual items in accordance with the detail requirements that are issued individually.

Aerospace — High-power solid-state power controller — General performance requirements

1 Scope

This document specifies the general performance requirements and test methods to determine the performance of the high-power solid-state power controller (HPSSPC) for use in the primary power distribution of aircrafts.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

[ISO 1540](#), *Aerospace — Characteristics of aircraft electrical systems*

ISO 7137:1995, *Aircraft — Environmental conditions and test procedures for airborne equipment*

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <https://www.electropedia.org/>

3.1

turn-on time

<DC device and non-zero-crossing turn-on AC device> time interval between the initiation of the *turn-on signal* (3.5) or the latest frame of the turn-on command data packet via the control signal bus and the time when the output reaches 90 % of its steady-state on value

Note 1 to entry: Shown in [Figure 1 a\)](#).

a) DC HPSSPC

b) AC HPSSPC

Key	
Y	load voltage
V	voltage
t	time
T_{ON}	turn-on time
T_{OFF}	turn-off time
T_R	rise time
T_F	fall time
1	rated control signal (which can optionally consist of control bus)
2	turn on (min)
3	turn off (max)
4	zero voltage turn-on
5	zero current turn-off

Figure 1 — Illustration of timing characteristics

3.2
turn-on time

<AC device with zero-crossing turn-on> time interval between the initiation of the *turn-on signal* (3.5) or the latest frame of the turn-on command data packet via the control signal bus and the time when the output switch is on at zero-crossing

Note 1 to entry: Shown in [Figure 1 b](#)).

3.3
turn-off time

<DC device and non-zero-crossing turn-on AC device> time interval between the initiation of the turn-off signal or the latest frame of the turn-off command data packet via the control signal bus and the time when the output reaches 10 % of its steady-state on value

Note 1 to entry: Shown in [Figure 1 a](#)).
