

BSI Standards Publication

Lubricants, industrial oils and related products (class L) — Family T (Turbines) — Specification for lubricating oils for turbines

National foreword

This British Standard is the UK implementation of ISO 8068:2006+A1:2019. It supersedes BS ISO 8068:2006, which is withdrawn.

The start and finish of text introduced or altered by amendment is indicated in the text by tags. Tags indicating changes to ISO text carry the number of the ISO amendment. For example, text altered by ISO amendment A1 is indicated by A1 A1.

The UK participation in its preparation was entrusted to Technical Committee PTI/7, Lubricants and process fluids.

A list of organizations represented on this committee can be obtained on request to its secretary.

This publication does not purport to include all the necessary provisions of a contract. Users are responsible for its correct application.

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 8068 was prepared by Technical Committee ISO/TC 28, *Petroleum products and lubricants*, Subcommittee SC 4, *Classifications and specifications*.

This second edition cancels and replaces the first edition (ISO 8068:1987), which has been technically revised. ISO 8068:1987 is only dealing with the specifications of TSA and TGA categories of turbine oils. This new edition gives specifications for all the turbine oil categories described in [ISO 6743-5:2006](#).

Introduction

New turbine technologies have emerged in recent years leading to the changes in lubricant requirements. For example, the development of single shaft combined cycle turbines has resulted in the use of a common lubrication system for both the gas and steam turbine. The lubricant should therefore meet the requirements for the lubrication of both pieces of equipment.

The growing concern regarding the environmental behaviour of lubricants is also leading to the use of biodegradable products when there are risks of leakage into soil or surface water. This is particularly the case with hydraulic power plants and lubricants in this application should demonstrate a low ecotoxicity.

Lubricants, industrial oils and related products (class L) — Family T (Turbines) — Specification for lubricating oils for turbines

WARNING — The handling and use of products as specified in this International Standard can be hazardous, if suitable precautions are not observed. This International Standard does not purport to address all of the safety problems associated with its use. It is the responsibility of the users of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

1 Scope

This International Standard specifies the minimum requirements for turbine lubricants, as delivered. It specifies the requirements for a wide variety of turbines for power generation, including steam turbines, gas turbines, combined-cycle turbines with a common lubrication system and hydraulic (water driven) turbines. This International Standard does not specify the requirements for wind turbines, which are dealt with in [ISO 12925-1](#)^[4].

Whilst power generation is the primary application for turbines, steam and gas turbines can also be used to drive rotating equipment, such as pumps and compressors. The lubrication systems of these driven loads can be common to that of the turbine.

Turbine installations incorporate complex auxiliary systems requiring lubrication, including hydraulic systems, gearboxes and couplings. Depending upon the design and configuration of the turbine and driven equipment, turbine lubricants can also be used in these auxiliary systems.

This International Standard should be read in conjunction with [ISO 6743-5](#)^[2], the classification of different turbine lubricant types.

The following lubricants are considered in this International Standard:

- mineral oils;
- synthetic lubricants, ester and polyalphaolefin types intended for high-temperature gas turbines;
- synthetic lubricants, ester and polyalphaolefin types, environmentally acceptable for use in hydraulic turbines;
- fire-resistant phosphate-ester type lubricants.

NOTE For the purposes of this International Standard, the term “% (m/m)” is used to represent the mass fraction.
