Brief History

This Standard is one of a series of ECMA Standards defining services and signalling protocols applicable to Private Integrated Services Networks (PISNs). The series uses ISDN concepts as developed by ITU-T and conforms to the framework of International Standards for Open Systems Interconnection as defined by ISO/IEC. It has been produced under ETSI work item DE/ECMA-00146.

This particular Standard specifies the signalling protocol for use at the Q reference point in support of the Transit Counter additional network feature. The protocol defined in this Standard forms part of the PSS1 protocol (informally known as QSIG).

This Standard is based upon the practical experience of ECMA member companies and the results of their active and continuous participation in the work of ISO/IEC JTC1, ITU-T, ETSI and other international and national standardization bodies. It represents a pragmatic and widely based consensus.

Compared to the 1st Edition of Standard ECMA-225 (published by ECMA in June 1995), this 2nd Edition incorporates changes in order to achieve complete alignment with International Standard ISO/IEC 15056:1997(E) published by ISO/IEC in May 1997.

Differences between this ECMA Standard and the ISO/IEC International Standard with which it is aligned are clearly identified.

Adopted as 2nd Edition of Standard ECMA-225 by the General Assembly of June 1997.
