American National Standard

An American National Standard implies a consensus of those substantially concerned with its scope and provisions. An American National Standard is intended as a guide to aid the manufacturer, the consumer, and the general public. The existence of an American National Standard does not in any respect preclude anyone, whether he has approved the standard or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standard. American National Standards are subject to periodic review and users are cautioned to obtain the latest editions.

CAUTION NOTICE: This American National Standard may be revised or withdrawn at any time. The procedures of the American National Standards Institute require that action be taken to reaffirm, revise, or withdraw this standard no later than five years from the date of publication. Purchasers of American National Standards may receive current information on all standards by calling or writing the American National Standards Institute.

Foreword

(This Foreword is not a part of ANSI C63.2-1980, American National Standard Specifications for Electromagnetic Noise and Field-Strength Instrumentation, 10 kHz to 1 GHz.)

Almost from the beginning of radio broadcasting, the electric utility companies were faced with problems of radio noise. In 1924 the National Electric Light Association appointed a committee to study the subject. The manufacturers of electric power equipment had encountered similar problems, and in 1930, a subcommittee of the NEMA Codes and Standards Committee was set up. The following year, the EEI-NEMA-RMA Joint Coordination Committee on Radio Reception was organized.

The Joint Coordination Committee issued a number of reports, among which was *Methods of Measuring Radio Noise, 1940*. This report included specifications for a radio-noise and field-strength meter for the frequency band 0.15–18 MHz. The report recommended procedures for measuring radio-noise voltage (conducted noise) from low- and high-voltage apparatus, making noise field-strength measurements near overhead power lines, determining broadcast field strengths, and collecting data upon which to base tolerable limits for radio noise. More than a thousand radio-noise meters were built, essentially in conformance with those specifications. They have been used to make extensive field, factory, and laboratory tests on many types of electrical apparatus.

During World War II, the needs of the armed services for instruments and methods for radio-noise measurement, particularly at frequencies higher than the broadcast band, became pressing and, in 1944, work on developing suitable specifications was begun by a special subcommittee of ASA Sectional Committee C63, Radio-Electrical Coordination. This special subcommittee developed a war-time specification which became the joint Army-Navy Specification JAN-I-225 which was issued in 1945 and later approved as American War Standard — Method of Measuring Radio Interference of Electrical Components and Completed Assemblies of Electrical Equipment for the Armed Forces from 150 kc to 20 Mc, C63.1-1946. This American War Standard included the specifications for a radio-noise meter similar to those included in the JCC 1940 report with the addition of some refinements and improvements.

In 1950, the ASA Sectional Committee C63 completed preparation of Proposed American Standard Specifications for a Radio Noise Meter, 0.015 to 25 Mc/s, C63.2, which was published in March 1950 for trial and study. An effort was made to take advantage of the extensive experience with meters made under the specification in the 1940 report as well as advances in radio engineering practice.

Experience with the proposed standard indicated a number of needed revisions and improvements. The various branches of the Armed Forces had developed new specifications for radio-noise meters since 1950, and the International Electrotechnical Commission published for CISPR (International Special Committee on Radio Interference) *Specification for CISPR radio interference measuring apparatus for the frequency range 0.15 Mc/s to 30 Mc/s*, Publication 1, First edition, 1961. The revised standard was published as American Standard Specifications for Radio-Noise and Field Strength Meters 0.015 to 30 Mc/s, C63.2-1963. In 1964, standard C63.3, covering instruments for the frequency range 20 MHz to 1000 MHz was issued, which was based upon the principles of measurement used in standard C63.2. More recently, CISPR Publication 16 has been issued.¹

The experience with meters made under the specifications set forth in the 1950 Proposed American Standard and the advances in radio engineering practice evidenced by these newer specifications for radio-noise meters have resulted in the inclusion of a number of revisions and improvements in this standard.

This standard was developed by Subcommittee No 1 on Techniques and Developments of ANSI Committee on Radio-Electrical Coordination, C63, and has been approved for publication.

¹See Section 19, [5].

Methods of measurement in the frequency range of this standard will be covered in the forthcoming companion standard ANSI C63.4, Methods of Measurement of Electromagnetic Emissions from Low Voltage Electrical and Electronic Equipment in the Range of 10 kHz to 1 GHz.

Ralph M. Showers, *Chairman*

Harold A. Gauper, Jr, *Vice Chairman*

Leonard W. Thomas, Sr, *Secretary*

<i>Organization Represented</i>	<i>Name of Representative</i>
Aeronautical Radio, Inc	B. R. Climie
American Radio Relay League	Gerald L. Hall
Association of Home Appliance Manufacturers	Gus W. Wallin
Association of American Railroads	Thomas M. Evans

Members-at-Large	Ralph M. Showers
	Leonard Milton
	Leonard W. Thomas, Sr

At the time American National Standards Committee C63 approved this standard, Subcommittee No 1, the Working Group which prepared this standard, had the following membership:

Ralph M. Showers, *Acting Chairman*

Carl C. Allen
James H. Allen
James C. Brown
Stephen Caine
Ralph Calcavecchio
E. W. Chapin
T. J. Cohen
Michael L. Crawford
Herman Garlan
F. E. Garlington
Thomas R. Gardner
H. A. Gauper, Jr

Robert L. Grant
Harold Greenberg
Ronald T. Harrold
Albert R. Kall
T. W. Kern
Warren A. Kesselman
J. C. Klouda
Nestor Kolcio
