Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

International Standard ISO 5252 was prepared by Technical Committee ISO/TC 5, *Ferrous metal pipes and metallic fittings*.

This second edition cancels and replaces the first edition (ISO 5252:1977), the standardized tolerances on thickness of which have been technically revised.

Introduction

This International Standard groups together the majority of the tolerances on dimensions used by ISO/TC 5/SC 1 in the drawing up of its International Standards concerning steel tubes.

It is intended for use as a basic document by all ISO technical committees concerned with the standardization of steel tubes.

It cannot, therefore, be used as a standard for the definition of a product.
