Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

International Standard ISO 7904-1 was prepared by Technical Committee ISO/TC 123, *Plain bearings*.

ISO 7904 consists of the following parts, under the general title *Plain bearings* — *Symbols*:

- *Part 1: Basic symbols*
- *Part 2: Applications*

Introduction

In the field of plain bearings there is a great number of multiple designations, thus considerable errors are possible in the interpretation of standards and technical literature. Because of this uncertainty, further designations are continuously added which increase the confusion. This part of ISO 7904 is an attempt to elaborate a uniform basic system of symbols for the future.
