Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

International Standard ISO 9119 was prepared by Technical Committee ISO/TC 83, *Sports and recreational equipment*.

This first edition cancels and replaces ISO 7264:1983, ISO 7265:1984 and ISO 7793:1984.

Introduction

Standardized dimensions for a binding mounting area enable a ski designer to locate reinforcing elements within this area. Standard dimensions also enable the binding designer to determine all interface dimensions for binding unit size, screw locations, etc. Bindings and skis manufactured in compliance with this International Standard are compatible.

Cross-country skis — Binding mounting area — Requirements and test methods

1 Scope

1.1 This International Standard specifies requirements and test methods for the binding mounting areas of cross-country skis, within which parts of the toe-clip binding in accordance with ISO 6960 may be mounted. Different values are specified for two groups of nominal ski lengths, l_N :

Group 1: $1\,750\text{ mm} < l_N \leq 2\,200\text{ mm}$

Group 2: $1\,300\text{ mm} \leq l_N \leq 1\,750\text{ mm}$

It specifically excludes alpine skis.

1.2 A designated binding attachment area, or binding mounting area (see 3.1), shall be provided by the ski manufacturer and shall be the only area of the ski subjected to this test.

1.3 This International Standard covers skis the bindings of which are attached by means of screws in area A_1 and screws, nails or other fasteners in areas A_2 and A_3 (see figure 1 and figure 2).

1.4 Using test screws loaded normal to the ski surface, the test methods specified simultaneously evaluate the tendency of

- screws to be pulled out;
- skis to delaminate;
- screw hole threads to strip.

2 Normative references

The following standards contain provisions which, through reference in this text, constitute provisions of this International Standard. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to

agreements based on this International Standard are encouraged to investigate the possibility of applying the most recent editions of the standards indicated below. Members of IEC and ISO maintain registers of currently valid International Standards.

ISO 6289:1985, *Skis — Terms and definitions*.

3 Definitions

For the purposes of this International Standard, the definitions given in ISO 6289 and the following definitions apply.

3.1 binding mounting area A_1 : Portion of the top surface of the ski which is intended for mounting toe-clip bindings. The standardized binding mounting area establishes the area on the ski within which the entire diameter of binding screws should be placed.

3.2 binding mounting areas A_2 and A_3 : Portions of the top surface of the ski intended for mounting other parts of a binding such as heel support plates. These are the areas on the ski within which the entire diameter of the part attachment fasteners should be placed (see figure 1 and figure 2).

1) To be published.
